Android Developers Blog

Android Developers Blog is been out since the birth of Android. It has blogs of interesting things from the Android world that I didn't know much about. The site also gives coding trouble shoots. Since it provides the secrets of Android, I will visit this site to get help through out my degree. I found one article really interesting. The article explains the differences of speed between a custom Chrome tab vs stock Chrome tab.

Ars Technica

Ars Technica is officially my new favorite place for tech news. This site goes in depth of explaining gadget breakdowns, software, hardware, and nearly everything else. Almost very review is full of images, which is quite entertaining. I found some interesting articles. In future, I will use this site to get more information before buying my next gadget.

Gamasutra

There is a lot in common between Mobile Development and Game Design. Mobile apps and games both involve coding, and designing. This explains that the future of gaming is mobile. I learned from this site that the most profitable game apps are the oldest ones. It shouldn't be hard for me to create a game in future since mobile and game go together.

Game Career Guide

The title of the website explains it all. This site is not only for the gaming industry, it is also for mobile industry. The site provides useful tools for getting in the gaming industry, such is guides and a tool to search for gaming related internship and jobs. I found out that that there is a a new program called AbleGamers. It aims to support game developers with disabilities. Designing a game is just as hard is design a mobile app.
